

STIRRING COFFEE PRESS

ABSTRACT OF THE DISCLOSURE

A stirring coffee press for brewing beverage grounds, such coffee or tea, while simultaneously compressing and agitating the grounds in a single container.

5 The stirring coffee press includes a container with a fitted lid, a plunger assembly slidably and rotatably received within the container and being attached to a hollow shaft which extends out through an opening in the lid, and a blade assembly attached to a shaft that extends and exits through the hollow shaft of the plunger assembly.

The hollow shaft of the plunger assembly has a handle attached to the end of the
10 hollow shaft, wherein the plunger handle is adapted to be received and retained into the aperture in the lid, thereby preventing the plunger assembly from rotating. The blade assembly shaft has a knob attached to its open end allowing the blade assembly to be freely rotated.
